How TODD Helped a Mid-Sized Construction Firm

Cut Project Delays by 15% and Improve Bid Management

A mid-sized commercial construction company specializing in office parks, retail spaces, and municipal buildings faced familiar challenges: missed deadlines, subcontractor miscommunication, lost documentation, and

costly delays from compliance lapses. Despite a strong reputation, they struggled to scale projects without ballooning overhead.

The leadership team realized their existing systems — spreadsheets, scattered emails, paper notes — were no longer enough. They needed a better way to stay ahead of tasks, track bids, and manage the dozens of moving parts on every project.

They turned to TODD.

The Pain Points

Before TODD:

- **Missed Deadlines**: Inspections were sometimes scheduled late. Subcontractors would "forget" deliverables.
- **Poor Communication**: Critical tasks discussed on job walks were written on whiteboards and lost.
- **Disorganized Subcontractor Management**: No centralized list of who was responsible for which task.
- **Compliance Failures**: Permits sat in limbo. Safety certifications expired without warning.
- **Scattered Documentation**: Change orders, RFIs, and field reports were buried in emails or hard copies.

How TODD Solved It

1. Centralized Task Management

TODD created an organized task list for each project. Tasks were automatically generated from meeting notes, emails, and even verbal walk-throughs using simple voice dictation. For example, "Schedule electrical inspection for Building B by May 15" became an official task, assigned to the right person with a due date.

Superintendents, project managers, and subcontractors had a single source of truth. No more "I didn't know."

- **Automatic Reminders**: TODD sent notifications 48 hours before deadlines.

- **Subcontractor Assignments**: Each trade partner could log in and view only their open items.
- **Real-Time Updates**: Daily roll-up reports showed overdue tasks, high-priority items, and upcoming compliance deadlines.

Result: Missed inspections dropped by 30%, and tasks completed on time increased by 22%.

2. Bid Pipeline Management

Construction success starts with winning work. The firm realized that chasing multiple bids without organized tracking was costing them.

TODD organized every bid opportunity into a pipeline:

- Submission Deadlines clearly displayed
- **Required Documents** (insurance certificates, bid bonds) attached to each bid task
- **Follow-Up Reminders**: If a general contractor didn't respond within three days, TODD prompted account managers to follow up.

This bid discipline helped the firm submit 18% more bids within deadlines and increased awarded contracts by 12% over six months.

3. Compliance Task Tracking

Permits, inspections, insurance renewals, and safety certifications were no longer managed manually.

TODD automatically created recurring tasks:

- Permit application follow-ups
- OSHA training reminders
- Insurance certificate expirations

Nothing fell through the cracks. Site shutdowns for compliance issues dropped to zero.

4. Better Documentation Control

Change orders and RFIs (Requests for Information) were uploaded directly to task threads. When someone completed a task ("Submit RFI to architect"), the supporting document was stored inside TODD.

- **Fast Retrieval**: No more searching email chains.
- **Clear Ownership**: Each document was tied to a task and assignee.

During one city inspection, a missing document was requested. Instead of delaying the project, the superintendent pulled it up on his phone through TODD in less than a minute.

Results

After six months with TODD:

- 15% reduction in project overruns (compared to prior 12 months)
- 30% fewer missed inspections and compliance failures
- 20% reduction in admin hours spent chasing tasks
- 12% increase in successful bid awards
- Faster responses during city inspections and stakeholder meetings

Conclusion

In construction, timing is everything. Missing a permit deadline, inspection window, or subcontractor deliverable can cost thousands — or tank a project. TODD helped this construction firm build a system that worked like an invisible project coordinator: creating tasks, assigning owners, tracking deadlines, and keeping documents tied to actions.

Bidding smarter and executing cleaner gave them a competitive edge without adding overhead.

TODD isn't just for contact management. In industries like construction, TODD becomes the backbone of operations, handling the day-to-day grind so leaders can focus on building, not babysitting.
